# Why GenAI Case Studies are Different

Your LLM works in dev. Fails in prod. Here's why GenAI case studies demand a different approach:

## **PROBABILISTIC SYSTEMS**

Unlike a button that always does the same thing, LLMs can hallucinate, drift, or produce wildly different outputs day to day. Interviewers expect you to know this.

## **NEBULOUS EVALUATION**

Did the chatbot respond correctly? That depends on context, tone, completeness, and whether the user trusted it enough to act. You need a structured method to define success.

## **ENORMOUS RISK**

A broken button annoys users. A hallucinating medical AI can cause real harm. Interviewers are watching closely to see whether you think about safety and contingencies.

# The **GATHER** Framework

**G****Ground the Problem**

Clarify user, current process, success metrics & compliance before touching any AI.

**A****Assess AI Appropriateness**

Decide whether GenAI, standard ML, or rule-based logic is the right fit, and say why.

**T****Technical Architecture**

Define RAG vs fine-tuning, retrieval method, safety filters, and state every tradeoff.

**H****Hallucinations & Risks**

Cover accuracy, safety, and operational risk buckets. This is where candidates stand out.

**E****Evaluation Metrics**

Define success at model, product, and business level — most candidates only mention one.

**R****Roadmap & Iteration**

Show a phased rollout: internal pilot → limited beta → full launch. Never ship to 100%.
